NeurIPS figure layout examples

These examples use the official NeurIPS 2026 single-column template. The top row contains two panels that each occupy 48% of the text width, placed side by side. The bottom row contains one full-width panel. All three panels were generated by `figspec` at their final physical size and are included without a width argument.

Single-column layout. The two panels are 190.8 pt (2.64 in) wide each, or 48% of the 397.5 pt text block. Their labels and legends are 8 pt, ticks 7 pt, and panel titles 9 pt. Because each PDF is already at the final size, the minipages only position the panels; they do not scale them. The left panel uses a blue/orange palette, and the right panel uses a green/purple palette so that the two panels remain visually distinct while sharing the same typographic hierarchy. The draw.io equivalents are 253.9 px for each panel, with label/legend sizes of 10.6, tick sizes of 9.3, and title sizes of 12.0 units.

Double-column layout. The lower panel is 397.5 pt (5.50 in) wide and fills the text block. It uses a third, red/teal palette. This is the same figure width that `figspec spec NeurIPS double` reports; the labels, ticks, and title keep the same sizes as the single-column panels. The draw.io equivalent is 529.1 px wide. The surrounding text is set in the NeurIPS template so that the relationship between the template's type scale and the figures is visible without relying on a screenshot.

Both rows are shown at natural size on a page cropped to the content. In a paper, the single-column panels can be treated as a two-panel figure, while the double-column panel is a separate full-width figure.
